

ActiveImage™ 2022

PROTECTOR

Server

A Data and System Protection Solution that supports both physical and virtual environments for Windows server

ActiveImage Protector™ Server provides a variety of features that meet and exceed a wide range of customers' needs. ActiveImage Protector™ backs up the entire Windows server that includes the OS, applications, and data. In the event of a disaster, ActiveImage Protector™ restores the entire system via an intuitive software operation. With our Standby feature, you can create standby virtual machines of your physical or virtual machines ready for an immediate startup. These virtual standby machines are kept updated by creating boot points that are synchronous with scheduled backup tasks or can be configured to create snapshots from live machines.

A variety of Storage Media are supported

- Cloud storage, including Wasabi, Amazon S3, Azure Storage, etc
- LTO and RDX tape to provide offline storage
- Locally connected HDD, NAS, USB storage, & SFTP server

Safely protect backup files

- Destination Isolation Option: Once the backup task completes, disconnect access to a backup storage
- Offsite Replication: Replicate backup files to a remote site
- Encrypt backup images

Disconnects LAN upon completion of a backup task

Flexible Scheduled Backup

- Backup tasks can be automatically executed according to the one-time, weekly, monthly or on a specific day of a week
- Multiple schedules can be defined for individual backup tasks (Multi-Scheduling Feature)
- Automatic backup when a machine is shutting down

Back up on daily basis according to a weekly schedule

Full backup each month for an ongoing weekly schedule backup task

Cloud Storage Wasabi with object lock is supported

- A bucket enabled with object lock is supported as a storage destination
- The same functions are provided for local NAS
- Supported as offsite replication target

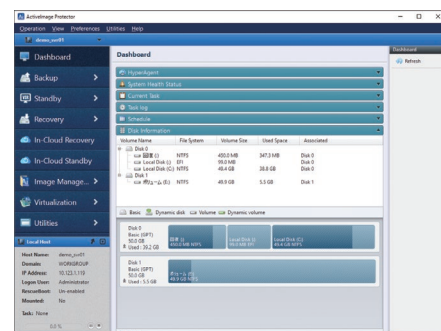

Flexible restore feature

- Restore a disk, a volume, or a single file or folder
- Restore to different physical or a virtual machines
- Directly boots up the virtual machine from a backup image file (HyperRecovery™)

Easy to operate GUI

- Intuitive and easy to operate GUI
- Built-in wizards guide you through every step to perform backup and restore operations
- Remote console is provided to remotely operate agents over network

New Features from Update (released on Sept. 7, 2023)

Actiphy StorageServer™

Actiphy StorageServer™ option enables to build secured backup storage for exclusive use with ActiveImage Protector™. Actiphy StorageServer™, as an independent destination storage for backup, protects the backup image files from the attack of a ransomware. The use of new QUIC protocol for data transmission enables to transfer data more safely with high reliability and ensures the security for the communication path. Actiphy StorageServer™ is engineered to take advantage of cache device in storage server, delivering faster data transfer speed than the destination storage device, that secures stable backup process and speed.

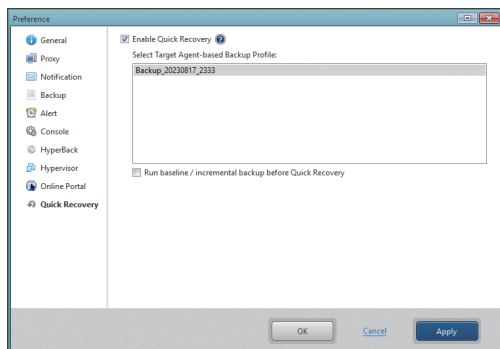

New Tracking Driver

New Tracking Driver is provided to monitor disk I/O and tracking the changes made from the last backup. The changes are saved in an incremental backup file, saving backup process time. The use of the new Tracking Driver suppresses a slowdown of backup processing speed caused by the increasing number of incremental backup files. You can select change tracking mode not to use a tracking driver.

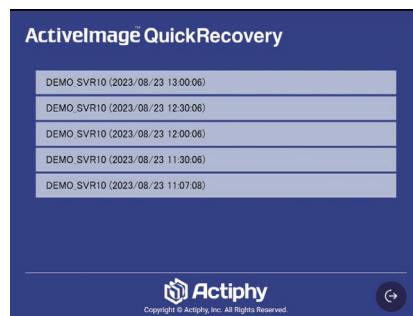

QuickRecovery

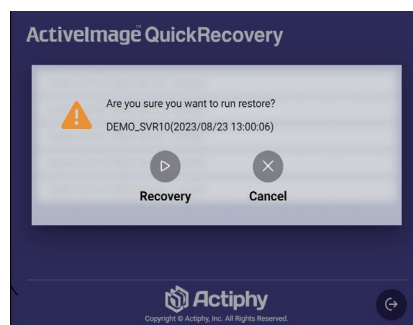

When booting up the system, QuickRecovery automatically starts recovery environment without the need for boot environment media. Boot up the recovery environment and select a specific restore point from the backup for immediately recovery. When restoring the system failed due to a software problem, recovery procedures complete on the restore target machine.

QuickRecovery Boot Settings

Select Recovery Point

Start Restore

Recovery Media Maker

Recovery Media Maker feature enables to create bootable recovery media with the backup source machine's image embedded for an ideal disaster recovery (DR) solution.

Recovery can be performed on dedicated recovery media alone, allowing recovery work to be performed even when the network is not available or when USB media cannot be brought to the site.

Recovery settings for the dedicated recovery media

Support for VMware First Class Disk (FCD)

Direct backup and recovery of VMware's FCD formatted disks is supported.

Backup Features

Quickly back up the entire system

ActiveImage Protector™ backs up the entire disk or a volume to include the OS, applications, and data files to a disk image. When disaster strikes, select a backup image to quickly restore for a complete recovery. Use the File or Folder Recovery option to restore a specific file or a folder from a backup image file.

File Backup

ActiveImage Protector™ includes File / Folder Backup to back up granularly selected files and folders and provides File or Folder Exclusion configuration options and back up from a network shared folder.

Incremental backup saves process time and storage demand

Incremental backups use an in-house developed Change Block Comparison (CBC) technology to include only the sectors that have changed since the previous backup. Using CBC technology instead of a driver reduces the impact on system resources.

Base Backup			
	1st incremental file		
		2nd incremental file	
			3rd incremental file

Upon completion of backup task, protect the destination (Destination Isolation Option)

Our ImageIsolate™ technology reduces potential malware or ransomware attacks to backup files by disconnecting access to backup storage drives over a network after backups complete. Four options are provided.

- Un-assign the drive letter from the local hard disk after completing the backup
- Take the destination local hard disk offline after completing the backup
- Eject the destination USB hard disk after completing the backup
- Disable the destination network connection after completing the backup

* After the destination USB HDD / SSD drive is ejected, it's necessary to manually plug in the drive and set online before starting the next task.

☒ Destination Isolation Options: ?

☐ Un-assign the drive letter from Local Hard Disk after backup completes
☐ Take the destination Local Hard Disk offline after backup completes
☐ Eject the destination USB Hard Disk after backup completes
☒ Disable destination Network Connection after backup completes

Ethernet02

A variety of Storage Media are supported

Save your backups to any available storage location, including local HDD, USB storage, NAS, SAN (fibre channel), SFTP, LTO or RDX tape, and cloud storage services (Wasabi, Amazon S3, Azure Storage, S3 compatible storage), etc., using a variety of system configuration and backup policies.

Wasabi with object lock is supported

A bucket enabled with object lock in Wasabi Hot Cloud Storage is supported as a storage destination. Source backup images in Wasabi Hot Cloud Storage and NAS are supported for restore. Save your large volume backup data in cost-effective Wasabi Hot cloud storage to further secure your data by isolating the backups from a cyber attack.

Version

LTO Tape Support suited for offline storage

The Tape Manager feature in this update provides enhanced operation of the tape pool and library. Allows movement of tapes within LTO tape library. Rescans tapes in the library, etc. When backups are directed to LTO tape with insufficient available space, the LTO tape is replaced with another to continue backup operation. Should a disaster occur, a backup from the LTO tape is used to restore the system.

Online backup ensuring consistency (Hot Imaging)

The hot-imaging backup is useful especially when backing up the system and the data frequently updated throughout the day and night on non-stop server. Create consistent backup of Windows VSS (Volume Shadow Service) aware server applications such as SQL Server, Exchange Server and Oracle.

Flexible schedule backup

Backup tasks can be automatically executed according to the onetime, weekly or monthly schedule, or a specific day of a week in a specific month. Schedule baseline and recurring incremental backup tasks to run subsequently.

Multi-Scheduling Feature

Multiple schedules can be defined for individual backup tasks. For example, you can create a new full backup each month for an ongoing Weekly Schedule backup task.

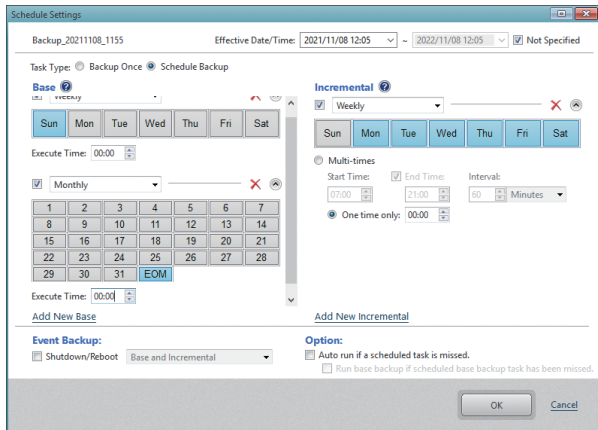

Image Retention Policy

The Image Retention Policy feature can be configured to automatically delete the obsolete backup image set when the number of backup image sets reaches the preset limitation and reduces the storage requirements.

Automatic backup at shutdown

ActiveImage Protector™ automatic backup when a machine is shut down or rebooted. When rebooting the system after a regularly scheduled system maintenance or in the event of an unexpected system shut down, a full baseline backup image is created before or after startup.

Run scripts after scheduled backup

Scripts can be implemented to run before, after, or during the moment snapshots are taken or after the backup image has been created. An example would be to execute a user-specified script to purge database cache before taking a snapshot and then resume the database after taking a snapshot (before starting a backup task), etc. Scripts can be implemented for base and incremental backup tasks.

Post-backup Process

Run BootCheck™, Replication and Consolidation tasks upon completion of a backup or at a specified time.

Distributed Backup Storage (Offsite Replication)

Perform a post backup Replication of your backup image files to an offsite storage share that includes local disk, network shared folder, FTP, FTPS, SFTP, WebDAV, Amazon S3, Azure Storage, Wasabi, OneDrive, Google Drive, Dropbox. Distribution of backup files increase the security level.

Automated backup "bootability" testing (BootCheck™)

BootCheck™ provides confidence that your backup images are bootable on a local or remote Hyper-V host. BootCheck™ boots up a virtual machine directly from a backup image file to confirm bootability. BootCheck™ can be run manually from the console at any time.

Consolidation of Incremental Backup Files

Regularly scheduled recurring incremental backup tasks may result in an increase in the number of backup files and a decrease in the performance of backup and restore processes. The Consolidation feature consolidates an uninterrupted series of incremental backup image files to one file according to a predefined schedule. For example, if the consolidation settings are configured to retain 7 incremental backup files and when 9 incremental backup tasks complete, the 1st and the 2nd most obsolete incremental files are consolidated to one file. As a result, 7 incremental files remain.

Restore Features

Fast and full-state recovery from a backup file

In the event of a hard disk failure, ActiveImage Protector™ can quickly restore a backup to the original machine, a different on-premise physical server or a virtual machine, bypassing the time-consuming process of reinstalling the OS, applications, configuration settings, reapplication of drivers, and data recovery. The built-in wizards guide you through every step to ensure recovery from the backup image file reducing the IT engineers' workload.

File Recovery feature

In the event of a system failure, you may only need specific files to restore in order to maintain continuity. The File Recovery feature optionally provides recovery of single files or folders from a backup image. All stream information and access rights of the individual files are inclusively restored.

Restore to virtual environment (HyperRecovery™)

HyperRecovery™ restores a backup image to a virtual machine configured on VMware vSphere or Microsoft Hyper-V. Otherwise, you can only create a virtual disk.

Restores physical or virtual machine backups to dissimilar hypervisors

RescueBoot

ActiveImage Protector™ includes RescueBoot. A feature when enabled, starts up the Actiphy Boot Environment in the event of emergency. The boot environment is booted directly from the internal disk, so that system administrator can restore the failed system without the use of external device.

VNC on RescueBoot

A VNC viewer is now provided to remotely operate the RescueBoot boot environment. System administrators can now restore the failed system in RescueBoot via VNC instead of the local machine.

Restore to physical machines with different hardware configuration (A.I.R.)

A.I.R (Architecture Intelligent Restore) included in Actiphy Boot Environment (Windows PE-based boot environment) is designed to install compatible RAID storage controller drivers after the recovery process and ensure the start up of the restored OS.

Enlarge or reduce target volumes or partitions during recovery

Only NTFS volumes may be restored to a volume in a size larger or smaller than the original source volume.

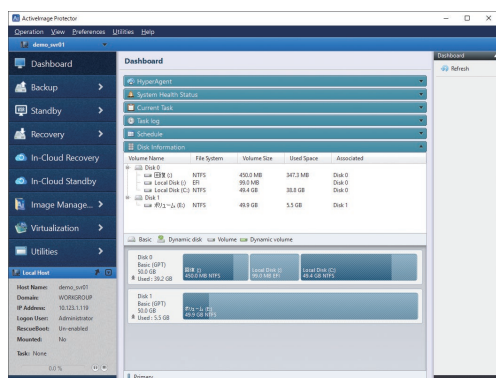

Repair Boot Configuration

Recovery of the BCD in the MBR is supported in the boot environment. In the event that the boot partition in the partition table was not backed up or the restored "C:" drive failed to boot up the system, use the "Repair Boot Configuration" tool to restore the BCD for the restored system.

Management Console

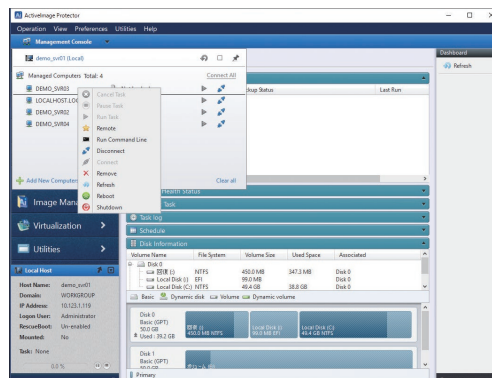

GUI provides tools for efficient operations

ActiveImage Protector™'s GUI provides dashboard window, displays real time monitoring of the status of tasks, logs, schedules, and disk information. Backup and Restore wizards windows make the software operation more intuitive.

Client management console

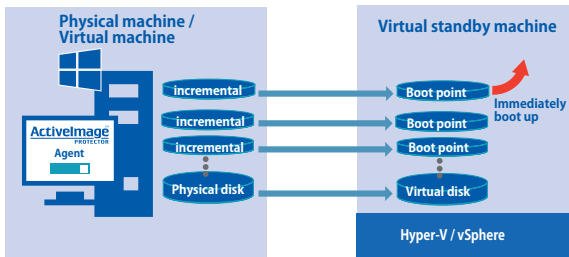

You can monitor the status of remote ActiveImage Protector™ agents over the network. Use the Client management console to monitor the status of backup tasks on multiple agents over network and schedule backup tasks.

Instant Recovery Solution

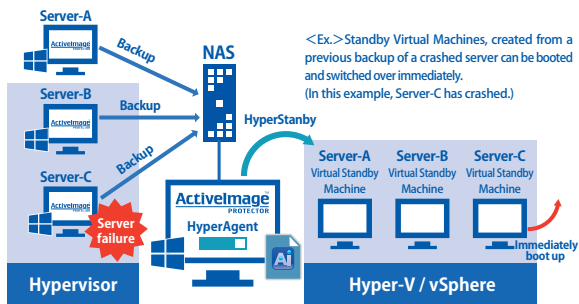

Creates virtual standby replica from a disk(vStandby™)

ActiveImage Protector™ integrates vStandby, a standby availability solution to replicate your live physical or virtual machines directly to a VMware vSphere or Microsoft Hyper-V host as a virtual standby replica (VSR), keeping boot points updated with scheduled incremental snapshots. When a disaster strikes, the virtual standby replica (VSR) can be started up in as little as two minutes.

Create standby virtual machine from a backup image (HyperStandby™)

Uses HyperStandby™ to create and maintain a standby virtual machine from backup images to Microsoft Hyper-V or VMware vSphere host, up-dating boot points synchronized with scheduled incremental snapshots. When a disaster strikes, the standby virtual machine (SVM) can be started up in as little as two minutes.

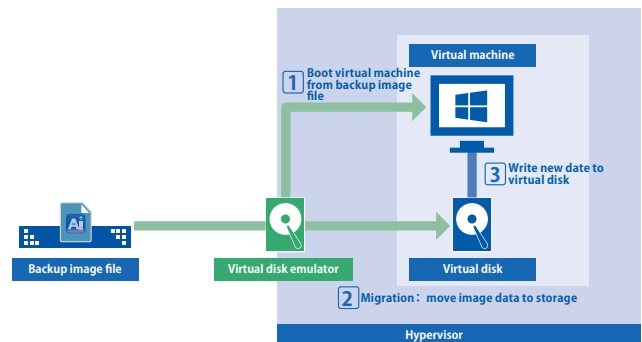

Replicate virtual standby machine from backup on cloud (In-Cloud Standby™)

In-Cloud Standby™ creates snapshots in cloud storage from backup images saved in a storage accessible from the cloud based on a predefined schedule. In the event of emergency, a volume created from the snapshot is attached to the virtual machine which is instantly started to resume the operation on cloud.

HyperRecovery LIVE!

HyperRecovery LIVE! boots up the virtual machine directly from a backup image file, migrates the live virtual machine to the restore target virtual disk in background bypassing the restore process providing uninterrupted VM operation.

Migration to virtual environment

Virtual conversion utility

A virtual conversion utility is provided to convert a backup image file or physical disk to virtual disk bootable as virtual machine. Conversion to the latest virtual disk format, VMware vSphere VMDK, Microsoft Hyper-V VHD / VHDX is supported.

Conversion from a backup image file to virtual disk and attach to virtual machine

The P2V conversion supports Microsoft Hyper-V, VMware vSphere as the target host to create the virtual machine attached with a virtual disk converted from a backup image file providing an immediate boot up of the virtual machine.

Conversion from a hard disk to virtual machine

The P2V conversion feature supports direct conversion from a hard disk to a Microsoft Hyper-V, VMware vSphere virtual disk format to create a virtual machine attached with the converted virtual disk. This bypasses P2V conversion from an image file reducing process time.

Virtualization Adapter

The driver for virtual machine can be injected into the current image file, which is saved as the ActiveImage Protector™ differential file (.aix). The differential file may be restored as a virtual machine.

P2V (physical to virtual) disk in local environment is supported on Windows PE

Conversion from physical to virtual disk (virtual disk only) is supported in Windows PE-based boot environment.

Management of Backup Files

Image Explorer

Windows Explorer opens a backup file providing direct access to restore individual files or folders from a backup file.

Image Mount

ActiveImage Protector™ can quickly mount an image file as a drive, allowing the restore of any files or folders from the image file. When image file is mounted as a writable drive, the changes made on the drive will be saved as a differential file.

Consolidate backup files

Regularly scheduled recurring incremental backup tasks create a growing and sometimes unmanageable number of incremental files. The Consolidation feature consolidates an uninterrupted series of incremental backup image files to a single file.

* When running scheduled consolidation tasks, please configure the settings for Post-backup Consolidation.

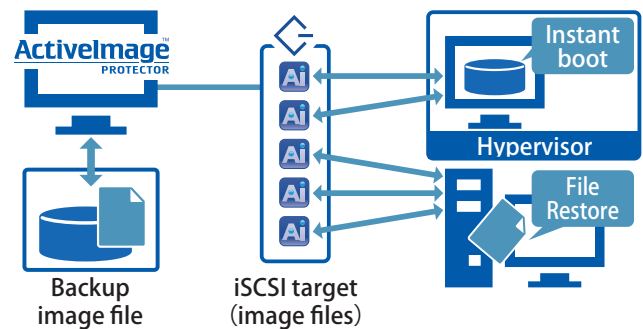

Archive Backup Files

Use the archive feature to unify a full base image file and all associated incremental files into a single backup file.

iSCSI Serves Backup Image Files as iSCSI Targets, Network File System server (Image Target Server)

ActiveImage Protector™ now utilizes iSCSI or NFS server to serve backup images as iSCSI targets to any local or remote iSCSI initiator for mounting backup images as local disks, or as NFS server to access backup images as VMDK file from NFS client; not only providing a method to recover files and folders from a backup, but provides immediate booting of a backup image attached to a virtual machine on a VMware vSphere hypervisor.

License Management Feature

Offline License File

Use of the offline license file provides license activation on a standalone PC without internet connection. Actiphy Authentication Service (AAS) acts as a Standalone Licensing server for computers grouped over intranet without requiring a persistent internet connection.

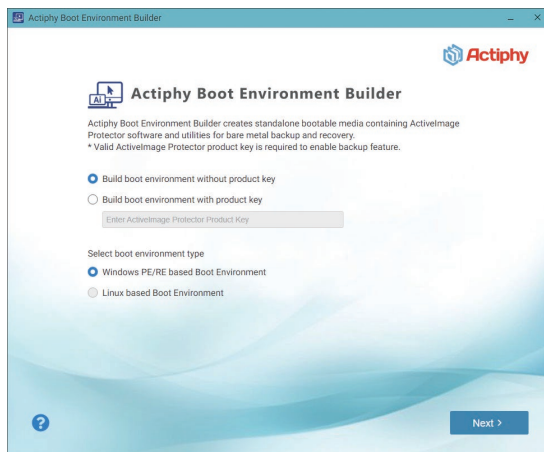

Subscription License

One-month and annual subscription licenses are now available as well as perpetual licenses. Options are provided to purchase one month, one year or a combination of both for the new or extended subscription license.

Free Add-on Tool

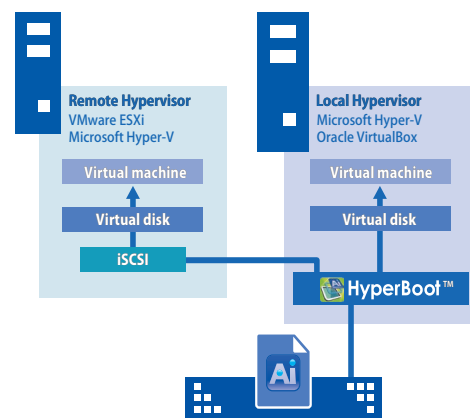

Actiphys BE Builder (boot environment builder)

ActiveImage Protector™ comes with boot environment builder for building a Windows-based boot environment when restoring the system or performing cold backup. You can create a standard Windows RE (Recovery Environment) based boot environment without installing Windows ADK or Windows PE. The Boot Environment Builder automatically detects required drivers, so that you can select the required drivers to install in the media which reduces IT engineers' workload. USB memory / HDD / SSD hard disk, ISO image file and optical media are supported to build the boot environment. If your notebook PC does not come with an optical media drive, the use of bootable USB flash memory / HDD / SSD offers a system recovery option.

HyperBoot™ add-on to immediately boot backup images as virtual machines

Use our free HyperBoot™ add-on to boot ActiveImage Protector™ backup image files as a fully functional virtual machine in only a few minutes on local and remote Microsoft Hyper-V, VMware ESXi, Oracle VirtualBox. HyperBoot™ serves as an interim replacement server to bridge the gap between disaster and recovery. Before a full-state recovery from the disruption caused by ransomware attack, use HyperBoot™ to check for bootability and verify integrity of the backup. Using VMware vMotion streamlines the recovery process by seamlessly migrating live virtual machines booted in vCenter to a hypervisor in a production environment.

ActiveVisor, add-on Centralized Management Console for ActiveImage Protector™

ActiveVisor™ provides a centralized management tool for ActiveImage Protector™ by monitoring networked client computers on which ActiveImage Protector™ agents are installed. Centralized management operation includes auto-discovery of managed computers, push-installing ActiveImage Protector™ agents, creating and deploying templates of backup tasks and configuration files, real-time monitoring of backup status, obtaining license information of ActiveImage Protector™ agents on managed computers, and remote operation of ActiveImage Protector™ agents.

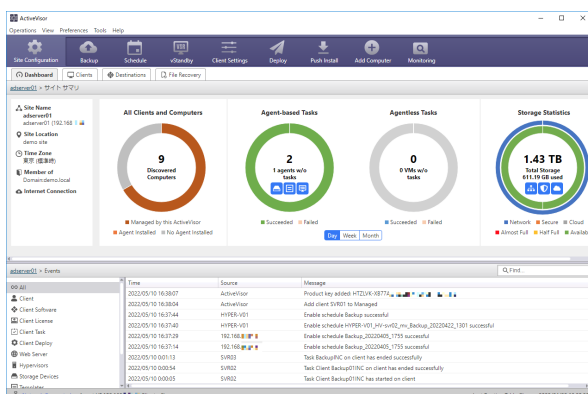

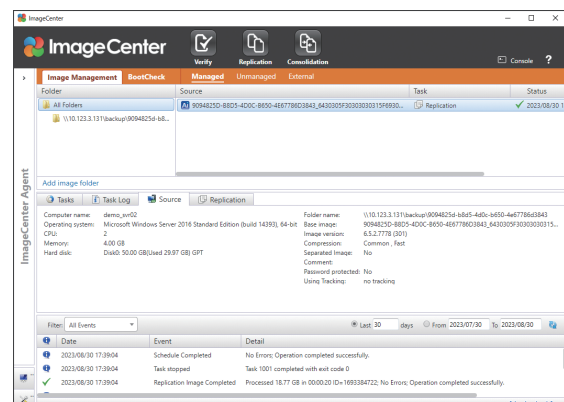

Image Management tool for backup files(ImageCenter™)

ImageCenter™ is a stand-alone image management tool for ActiveImage Protector™. With ImageCenter™, replication of backup image files to local or off-site high-capacity data stores can be scheduled, and automatically run the scheduled Replication task as well as Consolidation of incremental files, BootCheck™, Verify tasks. All of these can be offloaded to a dedicated system, greatly reducing resource demands on the source machine.

Others

Disk-To-Disk Copy

Disk-to-Disk copy is used when migrating data from a hard disk to a large-capacity disk or to an SSD. The Disk-to-disk Copy feature can select the entire disk or a specific volume to copy, or copy to a higher capacity disk or volume. Data volumes from different disks can be combined using Disk-to-Disk copy for a new single disk.

Eject RDX data cartridge

When enabling the [RDX data cartridge eject setting] option, you can configure the settings to eject RDX data cartridges after full or incremental backup on the specified day(s) of a week, at a specified time after full or incremental backup, or when the backup task completes.

USB SmartDetect™

Automatically detects when your USB backup disk is not connected and will prompt you to resume your backups once the disk is reconnected. Even when multiple USB hard disks are specified as the destination to save backup images, the USB SmartDetect™ feature can be enabled.

Command line execution support

Most of ActiveImage Protector™'s features can be used by specifying parameters for command line tool or with command file. ActiveImage Protector™'s CLI allows backups to be seamlessly administered by system management tools, if any, by using prepared script file.

Monitor task log entries in Windows Event Log Viewer

Every task event is now recorded in the Windows event log to provide better integration into the Windows Management Interface for a more unified experience.

The Installer is enabled to create an MSI file

The Installer is enabled to create an MSI file containing the product key dedicated to auto-distribution via Active Directory's Group Policy.

Encryption of Backup Images

ActiveImage Protector™ can create password-protected and encrypted backup images and supports up to AES 256-bit encryption. Enabling the encryption for the backup image file ensures that the backup file cannot be compromised.

Email Notification

Email notification can be sent (using SSL / TLS) to an email address of your choice. Notifications include successfully completed backups or backup failure. Email notification may be set to inform you of the summary of task execution and license status (expiration of the license period).

Cold-Imaging backup for static machines

Start up your computer from ActiveImage Protector™'s bootable media to create a backup image of a clean static system volume (immediately after installation of OS). Cold-imaging backup saving the point-in-time state of the failed system is convenient to examine the cause of the system failure.

Fast Bare Metal Recovery

ActiveImage Protector™'s lightning-fast restore engine dramatically speeds up recovery time. Bare Metal Recovery provides capabilities for initializing and creating partitions on the bare metal disk.

Agentless backup of virtual machines(HyperBack™)

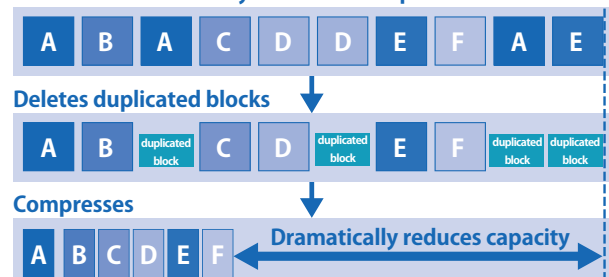

HyperBack™ backs up virtual machines configured on VMware vSphere or Microsoft Hyper-V hosts without the need for installation of ActiveImage Protector™ agents on the individual virtual machines.

* A license for every backup source virtual machine is required. If backing up more than two source virtual machines from the same host, "ActiveImage Protector™ Virtual" is recommended.

Save storage space with IDDC

Our Inline Data Deduplication Compression (IDDC) feature eliminates duplicate data while simultaneously compressing it, resulting in a significant reduction in backup storage requirements. Since backup using IDDC increases the CPU and memory usage, it is recommended to select Level 2 (Optimized) as this is the default level for IDDC.

Creates index for every block of backup stream
